

iOmniscient releases industry-specific solutions

iOmniscient has released a suite of applications created specifically for certain industries.

The IQ-Airport, IQ-Rail, IQ-Road, IQ-Retail, IQ-Oil and Gas, and IQ-Museum have all been designed and developed on the needs of each industry. For example, IQ-Road comes equipped with a speeding detection component whilst a queue management application has been included in IQ-Retail. IQ-Rail offers a special feature to detect people who cross the yellow line on a railway platform, with the ability to ignore people crossing the line when a train has

arrived in a station.

According to the company, the new solutions have been designed in recognition that each customer is unique.

"It is important to understand the specific requirements of each industry and tailor a solution that will meet their unique requirements. It is equally important not to inundate the customer with capabilities that they do not require if it does not add value," said Rustom Kanga, CEO of iOmniscient.

The IQ-Airport (left) and IQ-Rail (right) are among some of the new industry-specific applications released by iOmniscient.
